FARM EMPLOYMENT DOWN SEASONALLY

There was a total of 10,698,000 persons working on farms the first of November, the U. S. Department of Agriculture reported today. This number represents a decline of about a million and a quarter workers during the month of October, or somewhat more than the usual seasonal decrease. It is about 2 percent less than the 10,879,000 workers November 1, 1942, and 3 percent less than the 1938-42 average farm employment.

The decline from a year ago is entirely accounted for by a drop of nearly 7 percent in hired employment as the number of family workers is slightly higher this November than for the same date last season. The greater employment of members of the operator's family perhaps stems from three causes: (1) patriotic appeals to such persons to help during the emergency, (2) dismissal of schools in many communities this year to allow pupils to assist at home in the harvest of crops, (3) tendency of some farmers to get along as best they can with such family labor as there is available rather than to hire inexperienced help.

The change in numbers of family workers was not uniform throughout the country as some geographic divisions showed increases and others small declines. All geographic regions recorded decreases in numbers of hired workers, compared with a year ago, except New England and the Middle Atlantic States. The largest decline is shown by the West South Central States where stormy weather at the end of the month tended to reduce employment.

The estimate of 2,634,000 hired workers for November 1 is the lowest for the month since the depression years and is 8 percent less than the 1938-42 average.

Climatic conditions over most of the country the first of the month were favorable for doing outdoor jobs and in most rural sections farm activity was at an unusually high level. Where fall harvest was completed farmers were busy trying to catch up with an accumulation of maintenance work that had been postponed from time to time during the year.

The growing season in New England is well past by November 1 so requirements for farm labor decline seasonally. This fall, harvest operations were delayed by rainy weather especially during the latter part of October. This situation also prevailed over most of the Atlantic Region. As the bulk of crops had been housed by November 1, the delay in harvest probably did not result in any significant loss of production. Open, clear, fall weather prevailed over most of the North Central States and farm work was progressing well as

Continued from page 1.

October came to an end. Except for a few spotted areas the farm labor situation throughout the Corn Belt was not acute and necessary tasks were being accomplished more easily than a year ago.

In the South, cotton picking got off to an early start this fall, and by the first of this month it was nearing completion in some areas. Nearly ideal weather enabled farmers to push cotton picking and to harvest other crops, such as rice, sugarcane, and peanuts.

In the Mountain Region the farm labor situation is somewhat spotted primarily because of rains and snow which delayed harvest of some crops. A considerable acreage of sugar beets was still in the ground the first of November and some farmers were postponing beet pulling in order to dig potatoes which are more susceptible to frost damage. Schools have been closed and business places shut down temporarily to help cope with the farm labor problem.

As in most areas, West Coast fall weather was generally favorable for farm work; and on November 1 the farm labor situation was rather satisfactory. There were places of course where farmers were experiencing difficulty obtaining the workers needed but in general progress of farm work was considered better than at this time last year.

The average wage rates paid so far this season for picking cotton are the highest of record. Every cotton producing State reports picking rates to be above last year's high rates, and above the rates for all other previous years. The averages vary from \$1.25 for picking 100 pounds of seed cotton in South Carolina to \$2.70 in Arizona. The average for Arizona excluding rates for picking American-Egyptian cotton is \$2.10 per 100 pounds. In California, a wage ceiling of \$2.25 per 100 pounds was placed on cotton picking in October. According to the cotton reporters, the average rate so far this season in that State is \$2.10 per hundred pounds. The picking rate usually climbs higher at the end of the season because there are fewer bolls per plant and it takes longer to pick a bag of cotton so it may be that the rates will go still higher before picking is completed.
